YUANBO PANG

Agent Evaluation & Post-Training Measurement

yuanbopang@berkeley.edu · (+1) 408-460-7526 · yuanbopang.pro · GitHub · LinkedIn

Summary

Co-first author of **Agents' Last Exam** (ALE): I build the task environments, automated evaluators, and verifiable-reward pipelines used to measure frontier agents, and run those evaluations with frontier model teams — analyzing trajectories, investigating surprising results, and reporting failure modes back to the labs.

Education

University of California, Berkeley — B.S. EECS, GPA 3.762/4.0 (in-major 3.811) *Expected Dec 2026*

Stanford University (Summer Session) — CS 229: Machine Learning *Summer 2025*

Experience

Research Assistant, Berkeley RDI / BAIR (Prof. Dawn Song) *Oct 2025 – Present*

Agents' Last Exam (ALE) — co-first author arXiv:2606.05405 agents-last-exam.org

- Led the task pipeline and auto-scoring for ALE's 1K+ expert-designed, long-horizon tasks (55 subdomains), each an executable environment (`load`/`start`/`evaluate`) with programmatic graders — cross-domain evaluators producing **verifiable rewards** for both measurement and RL post-training (RLVR), with checks that keep graders trustworthy as tasks and models change.
- Operate large-scale sandboxed evaluation on GCP (container/VM task runners), including computer-use tasks with browser/desktop automation; run ALE evaluations with frontier model teams (OpenAI, Anthropic, Meta TBD Lab, Qwen, Seed; under lab guidelines) — analyzing agent trajectories, getting to the bottom of surprising results, and reporting failure modes back to the labs.
- For ALE V2, building ultra-long-horizon tasks from large-scale production software, with a harness that evaluates *teams* of agents: coordination, division of labor, and context handoff beyond single-agent benchmarks.

Robotics Research, Prof. Masayoshi Tomizuka's Lab, UC Berkeley *2026 – Present*

Large-scale robot-learning data benchmark — advised by Zhuo Xu and Prof. Tomizuka

- Built `roboqa`, a dataset-quality benchmark for robot/egocentric manipulation data, run at EgoDex scale (338K episodes, 829 h): three deliberately non-aggregated dimensions (recording health, distribution diversity, fixed-protocol trainability), versioned measurement limits, and every score published with full provenance (data fingerprint, measure versions, VLM judge, commit).
- Agent workflows run inside the data pipeline: VLM-judged annotation audits and automatic conversion of heterogeneous raw captures (HDF5, Zarr, RLDS, LeRobot) into a canonical, embodiment-tagged representation.
- Measure data by what it teaches: train and post-train VLA models on 500 h of curated egocentric data, then score the resulting policies in simulation — dataset quality read as downstream policy performance.

Founder, Equile — The Dry Lab for AI Scientists *Apr 2026 – Oct 2026*

- Built reproducible computing environments where research agents run real computational studies, each result carrying a provenance record — the same problems as operating an eval fleet: reproducibility, scheduling, monitoring, trustworthy outputs.

Publications

Agents' Last Exam. Yiyou Sun[*], Xinyang Han[*], Weichen Zhang[*], **Yuanbo Pang**[*], et al., Dawn Song. *Under review at NeurIPS 2026.* arXiv:2606.05405 #1 Paper of the Week, Hugging Face Daily Papers (Jun 2026). ([*]co-first author)

ScienceIDE: Turning World's Scientific Codebase into Agent Learnable Environments. Hejia Geng[*], Zesen Huang[*], …, **Yuanbo Pang**, et al. arXiv:2609.19134 #2 Paper of the Day, Hugging Face Daily Papers (Sep 2026).

Agent's GameDev Exam. Zonglin Di, Yinhe Wang, **Yuanbo Pang**, Yiyou Sun, et al., Dawn Song. *Under double-blind review at ICLR 2027* — agent evaluation in game development environments; author version available upon request.

Skills

Evaluation: benchmark & task design, automated evaluators/verifiers, verifiable rewards (RLVR), agent trajectory analysis, sandboxed task environments, regression investigation

Engineering: Python (primary), PyTorch, TypeScript, Docker, GCP, Modal, Postgres, agent harnesses, tool-use & MCP, Linux
